

IUIS Webinar: COVID-19 in South Africa

“Since the first case of COVID-19 on 5 March 2020 in South Africa, the epidemic grew exponentially with a doubling time of 2 days for the first 3 weeks until the effects of state-initiated interventions impacted reducing the doubling time to 15 days. The National response, which comprises 8 stages aims to flatten the curve. Stage 6 of the response on clinical care has provided new insights on the immune response, the role of the cytokine storm and the impact of dexamethasone on reducing mortality. The spectrum of Covid-19 disease from head to toe has transformed our initial understanding of Covid-19 as a respiratory distress syndrome.” (Source: [Webinar Page](#))
